Objective

Third-year Software Engineering student with hands-on experience in Unity, C#, gameplay programming, multiplayer game development, and computer graphics. Passionate about building game systems and continuously improving technical skills. Seeking a Game Developer Internship where I can contribute to gameplay features, graphics programming, and multiplayer systems.

Education

**Vietnam - Korea University of Information
and Communication Technology**

2023 – 2028 (Expected)

Information Technology, Major in Software Engineering

Da Nang, Vietnam

GPA: 3.37/4.0

Work Experience

Game Developer Intern

Jun 2026 – Jul 2026

Purus Games

Da Nang, Vietnam

- **Training:** Completed intensive training in JavaScript, HTML5 Canvas, WebGL, GLSL, and modern graphics programming.
- **Graphics Programming:** Developed 2D and 3D graphics applications using WebGL and implemented rendering techniques.
- **Computer Graphics:** Learned shaders, lighting, texturing, transformations, camera systems, and the graphics rendering pipeline.
- **Software Engineering:** Applied Git workflow, debugging, and collaborative development practices.

Projects

Vecto Arena – 3D Multiplayer Arena Game Prototype

2026

| *Unity, C#, Colyseus, Node.js, TypeScript, PostgreSQL*

Links: Client | Server | Demo Video

- **Core Gameplay:** Built Unity 3D arena gameplay systems including player movement, mouse aiming, camera follow, combat, weapon switching, HUD, minimap, death flow, and match result UI.
- **Multiplayer Integration:** Integrated the Unity client with a Colyseus WebSocket server for real-time synchronization of players, weapons, items, health, pickups, combat events, and match lifecycle.
- **Game Systems:** Implemented ScriptableObject-based weapon data, item pickups, projectile effects, medical kits, VEC pickups, shrinking safe-zone visualization, and character skin application.
- **Backend and Progression:** Built a Node.js/TypeScript Colyseus server with authenticated room joining, bot filling, authoritative match logic, item spawning, combat validation, XP/level progression, skin inventory, and NFT ownership sync.

| *Unity, C#*

- **Player Controller:** Engineered a mouse-controlled 2D spaceship controller with smooth movement behavior for responsive top-down arcade gameplay.
- **Combat Loop:** Implemented an automatic projectile shooting system and asteroid interaction logic to create a continuous survival-based gameplay loop.
- **Survival System:** Designed player health logic, asteroid collision detection, damage handling, and a 3-lives system to manage game failure conditions.
- **Game Flow:** Built a complete state-based game flow including Main Menu, Gameplay, Pause, Game Over, score tracking, and local high score persistence.
- **Player Feedback:** Integrated particle effects and sound effects for shooting, movement, impacts, collisions, and game over events to improve game feel.

Programming Skills

Languages: C#, Java, JavaScript, TypeScript, SQL

Game Development: Unity, Gameplay Programming

Backend: Node.js, REST API

Database: MySQL, PostgreSQL

Tools: Git, GitHub, Postman

Languages

English: Basic communication and technical document reading
